

***Eleutherodactylus coqui* (Puerto Rican Frog). Behavior.**

Date of observation: 12 June 2008. Location: Puerto Rico: El yunque; Río Grande. Coordinates: 18.29755, -65.7944. Elevation: 859 m. Voucher: image. This is a report of snail-feeding in *Eleutherodactylus coqui*. Along Route 191 near Pico El Yunque; at night, we observed a female *E. coqui* trying to swallow a gastropod mollusk (*Platysuccinea portoricensis*) in the bottom of a ravine and about 20 m from the road. The frog measured 47.6 mm SVL, with a mass of 7.2 g. The mollusk's shell measured 18.2 mm (diameter) by 11.0 mm (height) and had a mass of 1.5 g. This is the first record of feeding by *E. coqui* on this species of snail. A previous record of snail-feeding by *E. coqui* involved snails of the genus *Caracolus* (R. L. Joglar, 1998, Los Coquíes de Puerto Rico, Editorial Universidad de Puerto Rico, p. 40.). Both the frog and the snail were collected and preserved after being photographed. Accompanied by Miguel Acevedo and M. Isabel Herrera (University of Puerto Rico at Río Piedras).
