

***Eleutherodactylus planirostris* (Cuban Flat-head Frog). Distribution.**

Date of observation: 28 September 2011. Location: Big Ambergris Cay, Turks and Caicos Islands. Coordinates: 21.3069, -71.6313. Elevation: 5 m. Voucher: specimen (MPM 33996). This is the first report of this species from Big Ambergris Cay. This introduced species is established on the larger cays of the Caicos Bank and Grand Turk, but has previously never been recorded from the southeastern margin of the Caicos Bank (Reynolds, RG and ML Niemiller. 2010. *Reptiles and Amphibians* 17:117-121). This species was not present during surveys of this island 2007-2010 (RGR and Glenn P. Gerber) and

has probably arrived with the importation of construction material from Providenciales. It is restricted to the irrigated area near the operations campus. Twelve individuals were seen, including juveniles, at night in an irrigated area with a thick mat of grass and a high density of *Sphaerodactylus caicosensis*. Two vouchers were collected.
