

***Anolis equestris* (Cuban Giant Anole).
Distribution.**

Date of observation: 26 August 2013. Location: Lorient, Saint-Barthélemy. Coordinates: 17.905417, -62.822692. Voucher: image. Following a call from a resident, an adult male Cuban Giant Anole was captured in the area of Lorient on the island of Saint-Barthélemy. The lizard was on a Noni Tree (*Morinda citrifolia*), and according the residents it pursued a juvenile Lesser Antillean Iguana. Found near a tree nursery, it probably arrived on the island hidden in plants from Florida, as have Cuban Treefrogs (*Osteopilus septentrionalis*) and Red Corn Snakes (*Pantherophis guttatus*). This is the first record of this species on the Island of Saint-Barthélemy.
